

WHY USE EMAIL FILTERING?

ANTI SPAM

We take thousands of spam emails sent across the world each day and update these into our engines and databases for analysis and blocking.

With accurate catch rates of over 98.5% and a false positives rate of less than 0.004% we can eliminate your spam problems overnight.

ANTI VIRUS

By utilising multiple scanning engines from leading commercial and open source vendors we offer a tiered approach to anti virus scanning ensuring we stop viruses at the backbone level before they ever reach your servers or internal network.

Forcing emails through multiple virus scanning engines dramatically increases the reliability of our services.

ANTI PHISHING

From fake email pretending to be from your bank to customer service email purporting to be from large online internet services (e.g. Paypal, Egg or Amazon) phishing is big business for internet fraudsters. Identity theft is one of the fastest growing online crimes. Email phishing is one of the most common methods of gathering information used by these criminals. They gather your sensitive personal/company information. We help protect you from these scams by filtering you email and clearly identifying any fraudulent or redirected urls found.

Take Control of your Inbox Today!

Is spam costing your business time and money? Research estimates that spam constitutes over 70% of all email traffic. Spam adversely affects your employee productivity and compromises your network security. Host-it's email filtering solution eliminates all email borne threats including spam, viruses and phishing emails and protects your system from malware and Trojans. The majority of viruses that attack your PC are embedded in email that is destined for your in-box. Our managed email filtering service works by scanning your company's emails before they reach your internal corporate network. It prevents threats from reaching your network and effectively removes your servers from being external targets to spammers.

There are no capex costs to you. There's no hardware or software to install and no changes to your servers. A simple change of dns records externally and you can be up and running in as little as fifteen minutes!
